

Core Aeration

Your lawn has been aerated with the very best equipment available. The plugs which have been removed should remain on the lawn, as there are micro-organisms in the soil that help to decompose the thatch from the top as well as the bottom. The holes will help provide for penetration of water, fertilizer, lime and oxygen to the root zones.

This is an excellent time to over-seed your lawn to help improve the quality and density of the existing grasses. After over-seeding, do not gather the clippings until we have had sufficient moisture to settle the seed. **DO NOT USE INEXPENSIVE SEED, AS MANY UNDESIRABLE SEEDS ARE IN THESE BLENDS.** Consider using a blend of bluegrasses or improved tall fescue (like Jonathan Green black beauty ultra).

Lime

Pelletized Dolomitic Lime has been applied to your lawn. It is brown in color and almost dust free! Finely ground limestone is blended with a binder thus producing a firm pellet to dissolve quickly, immediately releasing the nutrients.

The calcium in limestone is also necessary in maintaining a desirable soil structure. Moisture and air movement through the soil are important for grass and plant growth. Calcium keeps soil mellow and crumbly, encouraging grass and plants to root deeper and grow faster. Because the soil is more open, it readily absorbs rainfall, thereby cutting down on run off and erosion. This also helps eliminate wear spots that would otherwise remain after the rest of the lawn dries.

The combination of near neutral Ph and an open, well aerated soil provides the best environment for micro-organisms and bacteria growth. These are beneficial organisms which help decompose organic matter and convert fertilizers to usable nutrients.

Due to the weight of this lime, you may continue your regular mowing practices.

LEAVES WILL NOT AFFECT THE APPLICATION

Thank you for once again giving us the opportunity to help improve your lawn!
