

TODAY WE APPLIED GRUB CONTROL

Today, we applied grub control to your lawn. It is the most effective grub control available. White grubs are turf damaging insects that feed on the root system of the grass plants in your lawn. Left untreated, grubs are capable of doing severe damage in a short period of time. When the infestation is heavy, the turf actually can be rolled back like a carpet.

Please note: If you have a mole problem, we are trying to control them by eliminating part of their food source (grub-worms). This does not guarantee, however, that the moles will be controlled. They may continue feeding on other soil organisms or just travel through the lawn.

We will automatically schedule grub control next year.
